

1. CREATE table RFM_model with fields list: CustomerName, Recency, Frequency, Monetary
2. INSERT into **RFM_model** by **SELECT** statement in Question 1 of **FINAL EXAM. (See Lab 09)**

Based on Question 1 in Final Exam, make some additional requirements:

1. What is the maximum Recency value?
2. What is the minimum Recency value?
3. What is the maximum Frequency value?
4. What is the minimum Frequency value?
5. Let's divide the Recency and Frequency equally to 5 intervals based on its maximum and minimum values. The bigger the recency, the lower the score. The higher the frequency, the higher the score.
6. Add to table RFM_model 2 columns Recency_score and Frequency_score corresponding to the score converted from 1 to 5.

Example:

CustomerName	Recency	Frequency	Monetary

7. Looking at the figure above, how many people are there for each customer segment? **WRITE 1 QUERY (IF POSSIBLE) OR MULTIPLE QUERIES TO SOLVE THIS QUESTION!**

Hint: Use SQL CASE to perform the interval for the values (Source: <https://mode.com/sql-tutorial/sql-case/>)
